

Parameters of a photo:

- **Tree trunk or a part of tree to be captured by the red triangle!!!** Independently of tree height and crown base area!
- Whenever possible, choose **homogenous background**.
- In case of group of trees, the recorded tree to be targeted at using the red rectangle.

1. Look for **homogenous background**, if not possible choose the approaching angle so that the background of the tree is the least disturbing given its surrounding. In the case of group of trees, choose the angle that provides the cleanest view of the recorded tree considering the least disturbing background.
2. If a tree is considered small: move closer so that you can frame it as shown above.
3. If a tree is tall: move away so that you can frame it as shown above.
